

# HTML GUIDE FOR 2010s AND 2020s

Sebastiano Castegnaro

## Abstract

This document will define the main guidelines for the web pages from 2010 to 2023. Here you will find all the classes tags and indications that **you have to follow**.

For the styling we opted for something that resemble a recent website look, and a color palette that could remind of the years 2010s.

The code is structured so that you don't have to stress about positioning, adjusting etc.. Just make sure you use the given classes in the right place and that you keep your code clean.

3.2	Images . . . . .	3
3.3	Tables . . . . .	4
3.4	Lists . . . . .	5

# 1 Page Composition

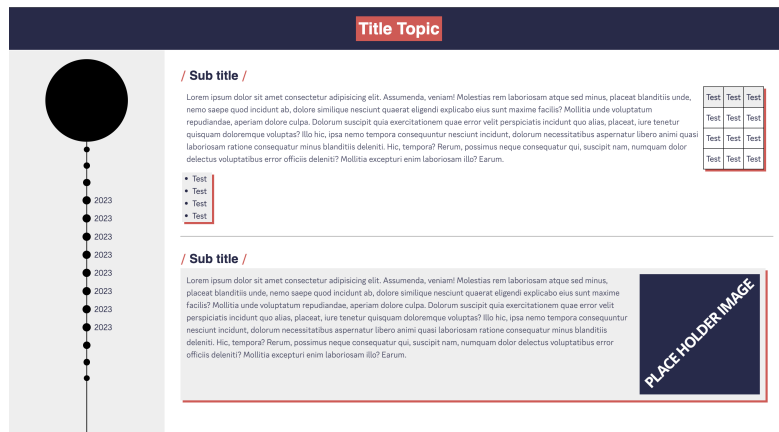

Figure 1: Example of the composition of the page

The page is composed by three main elements: a section for the title (blue one), a navigator (gray one) and a main section (white one).

You will be working mainly on the main section of the page. Here you are going to be able to add the actual content and information about the topics you have chosen. You are going to be asked **not** to touch the other sections, only if and when told, you will be required to edit those sections.

Every class is made so that customisation of the page results as much user friendly as possible, but it's still possible that you might encounter some issues, if any arises don't hesitate to contact us.

## 2 Classes

Class name	explanation
sub_title	relative to a <b>h2</b> , use it to make a section title.
dash	relative to a <b>span</b> , makes the dashes red.
text_container_gray	relative to a <b>div</b> , use it to make a simple paragraph in which you might have one or more elements. The background color, as the class name suggests, is gray. All the elements inside the div are in a flex, this means that every item in the div will be put in a different column.
text_container_white	relative to a <b>div</b> . The background color, as the class name suggests, is white. It behaves the same as the <b>text_container_gray</b> class.
text	relative to a <b>p</b> , use it to add padding to the text.
image	relative to an <b>img</b> , use it to add the right proprieties to an image.
list	relative to an <b>ul</b> , use it to add the right proprieties to a list.

## 3 Examples

### 3.1 Text

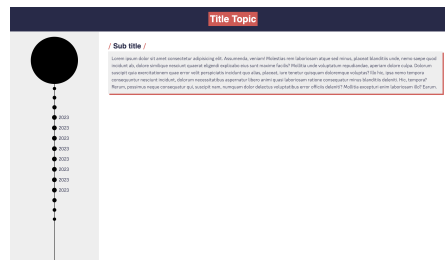

Figure 2: Example of a div with a text

In the first example we have a plain dic with a name and a text. For this you might just want to use the classes `sub_title`, `text_container_gray`, and `text`.

This is how the code looks like:

```
1 <!-- main content where you can put yours informations -->
2 <div class="main">
3   <!--Example of a sub title-->
4   <h2 class="sub_title">Sub title</h2>
5   <!--Example of div with text-->
6   <div class="text_container_gray">
7     <p class="text">
8       Lorem ipsum...
9     </p>
10  </div>
11 </div>
```

### 3.2 Images

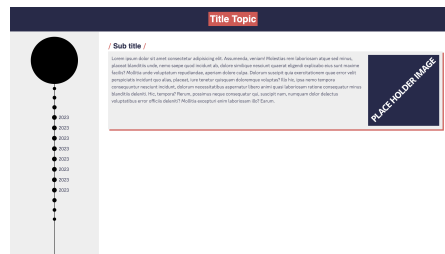

Figure 3: Example a div with text and an image

If you want to add an image, other than the classes `sub_title`, `text_container_gray`, and `text`, you are going to need to add the class `image` to the tag `img`.

This is how the code looks like:

```
1 <!-- main content where you can put yours informations -->
2 <div class="main">
3   <!--Example of a sub title-->
4   <h2 class="sub_title">Sub title</h2>
5   <!--Example of div with text and image-->
6   <div class="text_container_gray">
7     <p class="text">
8       Lorem ipsum...
9     </p>
10    
12  </div>
13 </div>
```

### 3.3 Tables

Figure 4: Example of a div with text and a table

If you want to add a table, other than the classes `sub_title`, `text_container_white`, and `text`, you just need to create the table by yourself, the class `table` is automatically set so that the style gets applied.

This is how the code looks like:

```
1 <!-- main content where you can put yours informations -->
2 <div class="main">
3   <!--Example of a sub title-->
4   <h2 class="sub_title"><span class="dash">/</span>
      Sub title <span class="dash">/</span></h2>
5   <!--Example of div with text and table-->
6   <div class="text_container_white">
7     <p class="text">
8       Lorem ipsum...
9     </p>
10    <table>
11      <tr>
12        <th>Test</th>
13        <th>Test</th>
14        <th>Test</th>
15      </tr>
16      <tr>
17        <td>Test</td>
18        <td>Test</td>
19        <td>Test</td>
20      </tr>
21      <tr>
22        <td>Test</td>
23        <td>Test</td>
24        <td>Test</td>
25      </tr>
26      <tr>
27        <td>Test</td>
28        <td>Test</td>
29        <td>Test</td>
30      </tr>
31    </table>
32  </div>
33 </div>
```

## 3.4 Lists

Figure 5: Example of a div with text and a list

If you want to add a list, other than the classes `sub_title`, `text_container_white`, and `text`, you are going to need to add the class `list` to the a div with inside an `ul`. This is how the code looks like:

```
1 <!-- main content where you can put yours informations -->
2 <div class="main">
3   <!--Example of a sub title-->
4   <h2 class="sub_title">Sub title</h2>
5   <!--Example of div with text and list-->
6   <div class="text_container">
7     <p class="text">
8       Lorem ipsum...
9     </p>
10    <div class="list">
11      <ul>
12        <li>Test</li>
13        <li>Test</li>
14        <li>Test</li>
15        <li>Test</li>
16      </ul>
17    </div>
18  </div>
19 </div>
```
